

# Prices of dwellings in housing companies

2019, September and 3rd quarter

## Prices of old dwellings in housing companies rose in the third quarter of 2019 in Turku, Tampere and Helsinki compared to the previous year

According to Statistics Finland's preliminary data, prices of old dwellings in housing companies rose compared to the corresponding quarter of last year by 1.5 per cent in Greater Helsinki, while in the rest of Finland they fell slightly. Compared with the previous quarter, prices fell by 1.0 per cent in Greater Helsinki and remained almost unchanged in the rest of the country.

### Development of prices of old dwellings in housing companies by quarter, index 2015=100

Among large towns, prices went up in Turku, Tampere and Helsinki compared with the corresponding quarter of 2018. Compared with the previous quarter, prices fell in Greater Helsinki and Oulu. Prices went up slightly in Turku and Tampere.

### Development of prices of old dwellings in housing companies quarterly, index 2015=100

Compared with 2015, prices of old dwellings in housing companies have risen most in Helsinki, Turku and Tampere. Price development has been more moderate in Espoo, Vantaa and Oulu.

In the third quarter, the price per square metre of a one-bedroom dwelling in a block of flats in the most expensive area in Helsinki was EUR 7,179 and in the most expensive area in Turku EUR 3,257.

Across the country, prices of dwellings have decreased in recent years, but the considerable differences in price development and price levels regionally and within towns should be noted. For example, in Pori, prices of old dwellings in housing companies have fallen by almost eight per cent compared to 2015. In the centre of Pori, prices have fallen by 2.7 per cent, while they have gone down by almost 12 per cent further from the centre. Within Helsinki, for example, the differences in price development are also remarkable.

Data on prices of dwellings in housing companies in different areas are available at [stat.fi/til/ashi/tau\\_en.html](http://stat.fi/til/ashi/tau_en.html). The price development of the areas is discussed in an article of the Tieto&trendit periodical (in Finnish) published on 31 October 2019.

## Prices of old dwellings in housing companies, 3rd quarter 2019<sup>1)</sup>

Area	Price, EUR/m <sup>2</sup>	Index 2015=100	Quarterly change, %	Yearly change, %
Whole country	2,086	103,1	-0,6	0,4
Greater Helsinki	3,719	109,0	-1,0	1,5
Rest of the country (whole country- Greater Helsinki)	1,605	97,6	-0,3	-0,8
Helsinki	4,320	113,3	-0,5	2,9
Espoo-Kauniainen	3,431	102,5	-2,1	-0,8
Vantaa	2,639	101,4	-0,8	-0,6
Satellite municipalities <sup>2)</sup>	2,107	97,5	-0,9	-0,9
Tampere	2,497	109,1	1,0	2,4
Turku	2,077	112,1	1,4	3,0
Lahti	1,654	96,7	1,1	-2,3
Kuopio	1,791	90,2	0,4	-4,7
Jyväskylä	1,824	96,1	-0,7	-2,2
Oulu	1,763	99,3	-3,3	-1,7
Pori	1,310	92,6	-3,9	0,5

1) Preliminary data

2) Satellite municipalities = Hyvinkää, Järvenpää, Kerava, Kirkkonummi, Nurmijärvi, Riihimäki, Sipoo, Tuusula and Vihti

## Prices fell in Greater Helsinki on a monthly level

According to Statistics Finland's preliminary data, prices of old dwellings in blocks of flats and terraced houses remained more or less unchanged in Greater Helsinki, while they fell by 1.1 per cent in the rest of Finland compared to September 2018. Compared with August, prices went down by 1.5 per cent in Greater Helsinki and rose slightly in the rest of the country.

## Development of prices of old dwellings in housing companies by month, index 2015=100

The data on old dwellings in housing companies are based on the Tax Administration's asset transfer taxation records. The reporting of asset transfer tax will change in November 2019, due to ongoing work in the Tax Administration related to this change the accumulation of the number of transactions is not currently comparable with earlier years, especially concerning the latest quarter. Instead of market activity, the numbers depict the reliability of the calculation of price data. Due to the implementation of the

amendment to the Asset Transfer Tax Act and the Tax Administration's information system renewal, statistical data is not accumulated from 1 October to 8 November 2019 and, therefore, statistics on prices of dwellings in housing companies will not be released in November and December. More about the change [at link](#).

Publication of the price index of dwellings in housing companies will continue in January 2020. Then the preliminary data on old dwellings in housing companies will be revised and the final data for 2019 will be published in connection with the release concerning the first quarter of 2020. Further information about data revisions can be found in separate tables.

The data on new dwellings in housing companies published in database tables are based on information on the transaction prices of the largest building contractors and estate agents. The statistics on new dwellings will be reviewed and the data in the tables will be updated retrospectively from 2015 onwards in January 2020.

# Quality Description: Prices of dwellings in housing companies

## 1. Relevance

### 1.1 Information content and purpose of use

The statistics on prices of dwellings in housing companies describe the unencumbered prices per square metre of old dwellings in housing companies, and monthly, quarterly and annual changes in them. Data concerning new dwellings are published quarterly and annually. The statistics contain data classified by area and type of building for the examined period and for a longer time period. The purpose of the statistics is to provide information about price development on the housing market.

### 1.2. Concepts, classifications and data

#### **The data and the data suppliers:**

*Old dwellings:* The data of the statistics on dwelling prices are based on the price information gathered by the Finnish Tax Administration for asset transfer tax calculation purposes. Additionally, the Tax Administration's Register of Real Estate Property and Statistics Finland's data on the dwelling stock that are based on the Population Register Centre's Register of Buildings and Dwellings are also used for the statistics.

*New dwellings:* The data of the statistics on dwelling prices are based on the information Statistics Finland receives via a private price monitoring service about transactions in new dwellings made by the largest real estate agents and building contractors. The monthly statistics do not contain information on new dwellings due to the scarcity of statistical data.

#### **Used concepts:**

*Dwelling:* A dwelling refers to a room or suite of rooms that is equipped with a kitchen, kitchenette or cooking area and is intended for year-round habitation.

*Price per square metre of dwelling:* The statistics are compiled from data on unencumbered prices, in other words, prices inclusive of the debt portion. The published price concept is price per square metre (EUR/m<sup>2</sup>). The published prices per square metre of old dwellings in housing companies are weighted geometric means of prices of square metre (EUR/m<sup>2</sup>).

*Floor area of dwelling:* The area of a dwelling, i.e. a residential dwelling is the floor area that is limited, on the one hand, by walls surrounding the dwelling, on the other hand, by the main walls and the surfaces of building parts in the inside of the dwelling necessary for the whole building. The floor areas of auxiliary spaces (utility space, walk-in wardrobe, etc.), bathroom, hobby room, fireplace room, sauna in a dwelling, washroom and changing room, and rooms used as working space if no hired employees work in them are also included in the floor area of a residential dwelling. Garage, cellar, sauna space in unfurnished basement, unheated storage space, balcony, porch, veranda, vestibule and unoccupied attic spaces are not included in the floor area of a residential dwelling.

*First home:* First-time dwelling transactions include those that are entitled to the exemption from the asset transfer tax for first-time homebuyers ([www.vero.fi](http://www.vero.fi)).

*Old/new dwelling:* An old dwelling refers to a dwelling that has not been completed in the examined year or the year before it. Respectively, a new dwelling refers to a dwelling completed in the statistical reference year or the year before it that is sold for the first time.

*Type of building:* The dwellings in the statistics are classified into blocks of flats and terraced houses according to type of building. The data on terraced houses also include detached houses whose tenure is based on ownership of housing company shares.

*Type of financing:* Dwellings financed with ARA subsidised housing loans and price controlled HITAS dwellings are not included in the non-subsidised dwelling category used in the statistics.

*Number of rooms:* A room is defined as a space with one or more windows that has a floor area of at least seven square metres and mean height of at least two metres. A hall, porch, bed recess or other similar space is not regarded as a room. Kitchen is not included in the number of rooms. Dwellings with at least three rooms are classified into room number category 3h+. In the monthly statistics data are not published by number of rooms due to the scarcity of statistical data.

*(Nominal) price index:* Describes the change in prices compared to the base period of the index concerned. On the basis of the price index, it is possible to follow the change in dwelling prices compared to different periods, that is, how much more or less a typical dwelling costs now than earlier. Because the composition of dwellings sold at different times is not the same, the calculation of the index aims to separate genuine price development from price changes caused by the characteristics of the dwellings sold.

*Real price index:* Describes the change in real prices compared to the index base period. The real price index is derived by dividing the point figure of the nominal price index for the area with the point figure of the Consumer Price Index for the whole country in the corresponding time period and base year.

*Point figure:* Point figure is a change quantity used in price indices, which expresses the price, average price or index of the comparison period relative to the price, average price or index of the base period. The point figure of the base period is usually denoted by the number hundred. For example, if the point figure of a commodity at a certain point in time is 105.3, the price of the commodity has risen by 5.3 per cent compared to the base time period.

*Distribution parameters:*

Q1 (lower quartile) = 25% of the observations remain below.

Med (median) = Middle observation when the observations are arranged in size order.

Q3 (upper quartile) = 75% of the observations remain below.

*Number of transactions:* Describes the recorded number of transactions made on dwellings in housing companies in the area. The data on numbers will become revised in the following releases so that the final data for the year are published in the release concerning the first quarter of the following year. The number of transactions also include transactions of price controlled HITAS dwellings and Housing Finance and Development Centre ARA dwellings in the area not included in the price indices and prices per square metre.

## **Classifications:**

*Annual and quarterly statistics:*

*Regional division, old dwellings:* The statistics use diverse area combinations, such as Greater Helsinki Area, satellite municipalities around the Greater Helsinki Area, regions and urban sub-areas. The Greater Helsinki Area comprises Helsinki, Espoo, Vantaa and Kauniainen, which in statistics is included in Espoo. The satellite municipalities are Hyvinkää, Järvenpää, Kerava, Kirkkonummi, Nurmijärvi, Riihimäki, Sipoo, Tuusula and Vihti. Regions are defined according to the decision of the Council of State. The urban sub-areas are formed of postal code areas using price level and location as the criteria. Details of the used regional classifications are appended to this publication and can be found on Statistics Finland's website.

*Regional division, new dwellings:* Due to the low number of transactions, the statistics on the prices of new dwellings are compiled according to a less detailed regional division than the statistics on the prices of old dwellings. The classification used in the statistics on the prices of new dwellings also takes into consideration the needs of the Consumer Price Index, hence the regional classification uses the division into major regions. The area categories are Whole country, Greater Helsinki, Rest of Finland (the same as with old dwellings, Whole country exclusive of Greater Helsinki), Rest of Uusimaa (exclusive of Greater Helsinki) and major regions Southern Finland, Western Finland, Eastern Finland, and Northern Finland.

*Monthly statistics:*

Regional division: The area categories are: Whole country, Greater Helsinki, Rest of Finland (Whole country exclusive of Greater Helsinki), Satellite municipalities (Hyvinkää, Järvenpää, Kerava, Kirkkonummi, Nurmijärvi, Riihimäki, Sipoo, Tuusula, Vihti), Helsinki, Espoo-Kauniainen, Vantaa, Tampere, Turku, Oulu and major regions Southern Finland, Western Finland, Eastern Finland, and Northern Finland.

## 2. Methodological description

The statistics on the prices of dwellings in housing companies describe the unencumbered prices per square metre of dwellings in housing companies and changes in them. The statistics include both unencumbered prices per square metre calculated as averages directly from the data and the price index for dwellings in housing companies that describes the change in prices.

The price index aims at answering the question how much more or less a typical dwelling in a housing company now costs compared with before on the basis of the total number of actual transaction prices. Because the composition of dwellings sold at different times is not the same, monitoring average price changes is not sufficient. For example, the relative shares of different types of dwellings among sold dwellings may vary from quarter to quarter. When calculating the index, the so-called hedonic method is used, where the aim is to separate the genuine price development from price changes caused by dwelling characteristics at different points in time with the help of data classification and regression analysis.

**Classification:** Because the location, type of building and number of rooms are the most important price determinants, the composition of sold dwellings is first standardised by classifying these variables. The regional classification has been constructed so as to be geographically meaningful and as homogeneous as possible in respect of price levels of dwellings. In the regional classification, larger cities have been divided into several sub-areas and smaller municipalities, where only few transactions take place, have been combined. Within areas, dwellings in a housing company are divided by type of building into two categories: blocks of flats and terraced and detached houses. Dwellings in blocks of flats have been classified further by the number of rooms into one-room dwellings, two-room dwellings and dwellings with three or more rooms. Terraced houses have been divided by the number of rooms into two categories: dwellings with fewer than three rooms and dwellings with at least three rooms.

**Regression model and quality adjustment:** The used classification does not, however, homogenise the data sufficiently, because inside a class, dwellings differ from another in terms of micro-location, floor area, year of completion, and so on. The price data on old dwellings contain data on the year of completion, floor area, and location of the dwelling on the postal code level. The price data on new dwellings include data on the floor area and location of the dwelling on the postal code level. With the help of the regression model, these data are used to quality adjust for changes in the composition of the data between the base and reference periods.

An example of a quality adjustment: during the statistical quarter the dwellings in a certain area have, on average, a larger floor area than the dwellings in the base period. In the quality adjustment, the index is revised upwards as otherwise the lower price per square metre caused by the larger floor area would erroneously be interpreted as a drop in prices. If there is no difference in the floor areas of the dwellings sold during the statistical quarter compared to the base period, no quality adjustment is needed.

The index point figure for the whole country is derived by aggregating the index class-specific price changes and the quality adjustments with the so-called log-Laspeyres index formula. The weights for old dwellings are derived as value-shares of the stock of dwellings in housing companies in 2015. The weights of new dwellings are the consumption expenditure weights of the dwellings purchased in 2008 to 2012. The data of five years surrounding the base year are utilised in the calculation of the weights of new dwellings because the number and sizes of purchased new dwellings vary much by year and region.

A more detailed methodological description has been published in Statistics Finland's Studies series (Koev, Eugen: Combining classification and quality adjustment in constructing a House Price Index. Helsinki, Statistics Finland, Studies series (2013)).

## 3. Correctness and accuracy of the data

### 3.1. Reliability of the statistics

The statistics on the prices of old dwellings are based on the Tax Administration's asset transfer tax data, which cover the transactions of all dwellings whose tenure is based on ownership of housing company shares. All transactions of old housing company dwellings are not included immediately in the statistics, because the purchaser is allowed two months to pay the asset transfer tax. Supplementing of the data is

also affected by whether the data have been reported on time and whether the electronic questionnaire has been used in reporting.

The statistics on the prices of new dwellings are based on data obtained from the largest real estate agents and building contractors and the data are final when first published. The number of transactions describes the number of transactions in the statistics, not the total number of transactions of new dwellings.

The price indices of old and new units in housing companies and the published prices per square metre include dwellings on both own and rented plots. The price indices and prices per square metre of old units in housing companies do not include price controlled HITAS dwellings.

The results of the statistics describe the housing company share market relatively reliably. However, the number of included transactions should be taken into consideration. If few transactions have been made, a couple of deviating cases may affect the average price for an area significantly. Therefore, the development of prices should always be examined in the longer term and not only for a certain time period.

### 3.2. Accuracy of the statistics

Cases with missing information about transaction prices or floor area, or with exceptionally high or low price due to contract within family or error in data entry are not accepted into the statistics. The acceptable ranges of prices per square metre by area are defined yearly for old and new dwellings.

[The price data become revised](http://tilastokeskus.fi/til/ashi/rev_en.html) ([http://tilastokeskus.fi/til/ashi/rev\\_en.html](http://tilastokeskus.fi/til/ashi/rev_en.html)) over the year so that the final data for the year are published in the release concerning the first quarter of the following year. On the average, the revision in monthly statistics on prices of dwellings amounts to 0.3 per cent either way for the whole country. The revision is larger for smaller geographical areas. The average revision in quarterly statistics amounts to 0.2 per cent either way for the whole country.

It is not recommended to use the latest month's number of transactions when describing the activeness of trading; it rather describes the reliability of the price index and price per square metre in the latest time period. If only a few transactions are known, a couple of deviating cases may affect significantly the average price for an area.

The numbers of transactions in the latest months should be examined over a longer period than one month. Particularly in summer months, the number of transactions in the latest release of the monthly statistics may remain lower than usual and become revised in the coming months.

### 3.3. Use of the parameters of the statistics

Because the price index takes into account changes in the distribution of year of completion, floor area and location of dwellings sold at different points in time, and their effects on prices, the average prices of the statistics vary differently from the price index. The price index and the average price are each useful measures for different situations.

The *price index* endeavours to measure as accurately as possible how much more/less an average dwelling in a housing company costs now than it did before. The *average price*, in turn, describes the prevailing price level for sold dwellings without considering whether they are older, newer, larger or smaller than dwellings sold before.

## 4. Timeliness and promptness of published data

### 4.1. Publication frequency and measurement period of the statistics

The statistics on prices of dwellings in housing companies are published monthly, quarterly and annually. Monthly data are released one month from the end of the statistical reference month and quarterly data are released simultaneously with the data for the last month of each quarter. Quarterly data are statistically more reliable than monthly data and contain more detailed information by area. The annual statistics are published in connection with the statistical release for the first quarter of the year following it. The annual statistics are published in connection with the statistical release for the first quarter of the year following it.

## 4.2. Preliminarity of the statistics

When the statistics are published they cover approximately two-thirds of all transactions made in the latest quarter. The latest monthly statistics contain around 50 per cent of all transactions. Statistics Finland receives the data on the remainder as they arrive at the Tax Administration.

Monthly and quarterly data are updated retrospectively in connection with each release so that the final data for the statistical year are published with the data for the first quarter of the year following it.

## 5. Accessibility and transparency of the data

A latest statistical release will be published from the statistics on Statistics Finland's web pages on the publication date of the statistics on prices of dwellings. Data concerning dwelling prices can also be found on Statistics Finland's web pages and database service. The essential metadata have been described in this document, which is incorporated into the publication of statistics on dwelling prices in housing companies. This document is also available on Statistics Finland's web pages.

These statistics cover only dwelling transactions in housing company shares. Especially out of the Greater Helsinki area, there are numerous real estate transactions that are not included in these statistics. Statistics Finland publishes a separate price index on real estate prices. Data on real estate transaction prices by municipality are available from the National Board of Survey.

## 6. Comparability of the statistics

### 6.1. Comparability with other data

When these statistics are compared with data from other producers, the source of the basic data should be considered. The data on old dwellings published by Statistics Finland's are based on the Tax Administration's asset transfer tax statements. The monthly data become revised during the following months so that the final data for the year are published in the release concerning the first quarter of the following year. The data for the annual statistics cover nearly all private transactions and the transactions carried out through real estate agents. .

For example, the data published by the Union of Real Estate Agencies in Finland (KVKL) are based on the dwelling transaction data reported by the largest real estate agents and building contractors. The data covers 70 to 80 per cent of transactions in old dwellings, in addition to which the material contains data on real estate transactions and transactions in new dwellings. The price index of dwellings in old blocks of flats published by KVKL differs from that published by Statistics Finland, for example, in terms of quality standardisation and the calculation method of the index. The aim of the price index published by Statistics Finland is to describe the price development of the entire dwelling stock, while the aim of KVKL's index is to describe the price changes in completed transactions.

### 6.2. Comparability over time

Data compiled from the Tax Administration's asset transfer tax data are available on prices of old dwellings in housing companies quarterly starting from the year 1987. Older data are available going back to 1970. Data provided by real estate agents are available for the period 1970 to 1986 and the used classification is much less detailed. As regards new dwellings, the time series based on data provided by real estate agents have been calculated quarterly from 2005 onwards.

In January 2013, combinations of register data were updated. This increases the number of transactions by around three to five per cent on the annual level compared with earlier years.

From the beginning of 2015, the quality adjustment models and the weights used in the index calculation of both old and new dwellings in housing companies were updated. In terms of the calculation of old dwellings in housing companies, the procedure for checking prices was also updated. The monthly indices of old dwellings in housing companies, as well as the quarterly and annual indices of old and new dwellings in housing companies, have been backcasted from the year 2010 taking these changes into account. Due to the changes, the backcasted indices can to some extent differ from previously published indices. Most

differences are generated in regions where the number of observations is low. For the whole country, the differences are small.

The calculation of the numbers of transactions of old dwellings in housing companies was renewed in the beginning of 2016. In the renewal, the joint use of transaction data and various register data was improved, as a result of which transactions of old dwellings in housing companies can be differentiated in future better than before from the transactions of new dwellings. The methodological renewal also has an impact on the yearly published transaction sum data of old dwellings in housing companies, and on the quarterly published prices per square metre by post code. In future, data according to the new method are used for these. Comparable time series have been produced with the renewed method on all the data to be published.

From the beginning of 2018, the quality adjustment models and the weights used in the index calculation of old dwellings in housing companies were updated. In this connection, the checking methods for prices and surface areas were updated. The review procedure of observations included in index calculation was harmonised with the calculation of the numbers of transactions that was renewed in 2016. In addition, the new base year 2015=100 was taken into use. The calculation method for prices per square metre was changed in aggregation from the arithmetic mean to the geometric mean, which caused differences compared with previously published data, especially at aggregate level.

## 7. Coherence and consistency

In addition to the statistics on prices of dwellings in housing companies, Statistics Finland releases data on the price development of single-family houses and single-family house plots in the quarterly statistics on real estate prices. The prices of dwellings in housing companies and single-family houses are included in the indices of owner-occupied housing prices delivered to Eurostat (Council Regulation (EC) No. 93/2013). The indices of owner-occupied housing prices are published on Eurostat's website.

In addition to the statistics on prices of dwellings in housing companies, Statistics Finland releases quarterly statistics on real estate prices. Besides the data published by Statistics Finland, real estate agents, credit institutions and banks also publish information concerning dwelling prices and their development.
